

Prediction	Manipulation / analysis	If H1 (policy-type)	If H2 (real remapping)
1. Occupancy-matched trajectories	VR/treadmill with repeated fixed trajectory pre/post learning	reward-ward shift vanishes	reward-ward shift persists
2. Dopamine / RPE silencing	Optogenetic VTA inhibition during reward learning	no effect on (absent) shift	shift is abolished
3. Behavior vs remapping correlation	Correlate per-animal learning speed with remapping magnitude	strong positive correlation	weak / no correlation
4. Goal-vector vs field density	Move a learned goal; track bearing tuning and field density together	both follow the goal equally	vector code retargets fast, density lags
