Behavioral success vs. representational remapping (n=7 clean seeds)
Cycle-1 learning → field shift to A
Spearman r=+0.11, p=0.819
% cells toward A (pre→postA)
Cycle-1 test success (reward A)
Cycle-2 learning → field shift to B
Spearman r=+0.20, p=0.670
% cells toward B (postA→postB)
Cycle-2 test success (reward B)
End-of-training performance → →B remapping
Spearman r=-0.51, p=0.243
% cells toward B (postA→postB)
Last-10 success rate (end of c2)
